## About

Klim facilitates the transition to regenerative agriculture for farmers across Germany. The platform incentivizes practices such as cover cropping, reduced tillage, and optimized crop rotation which actively remove CO<sub>2</sub> from the atmosphere and store it as organic carbon in the soil (SOC).

In addition to carbon sequestration, these methods significantly reduce on-farm emissions from fertilizer and fuel use. The Klim platform provides a digital MRV solution to document these changes, ensuring transparency and high-quality data verification.
